

COVID-19 POLL

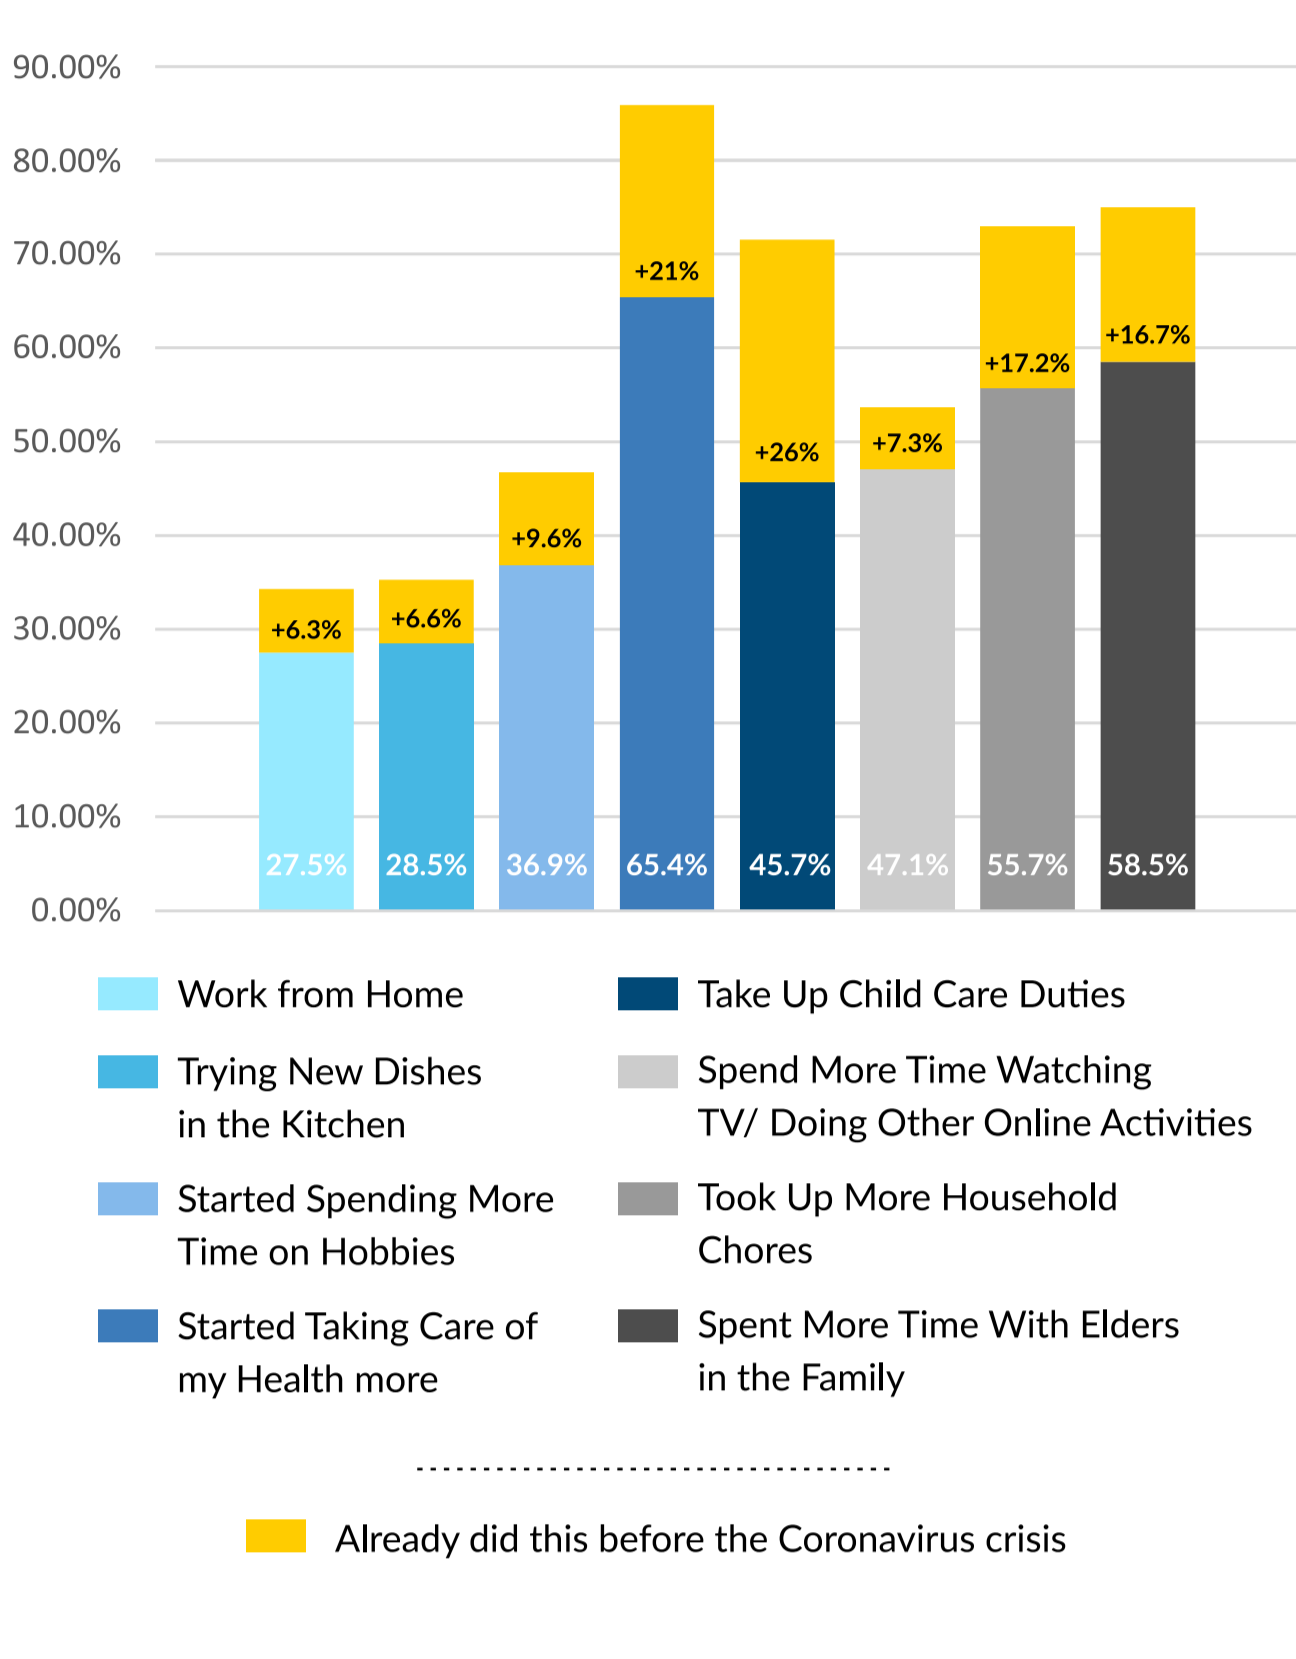

Only 27% of respondents shifted to working from home during the Coronavirus lockdown in India

Team CVoter conducted surveys during 8th to 12th May 2020 to find out about the economic wellbeing of Indians across the country amidst the Coronavirus. In this survey, respondents were asked about the impact of the nationwide Coronavirus lockdown on their work-home life, working patterns, income, job security and optimism about the future.

Team Polstrat will break down the overall economic impact on respondents and their job security during the Coronavirus crisis.

Q Have you done these things on a personal basis or have these things happened to you due to the spread of Coronavirus?

Key Findings

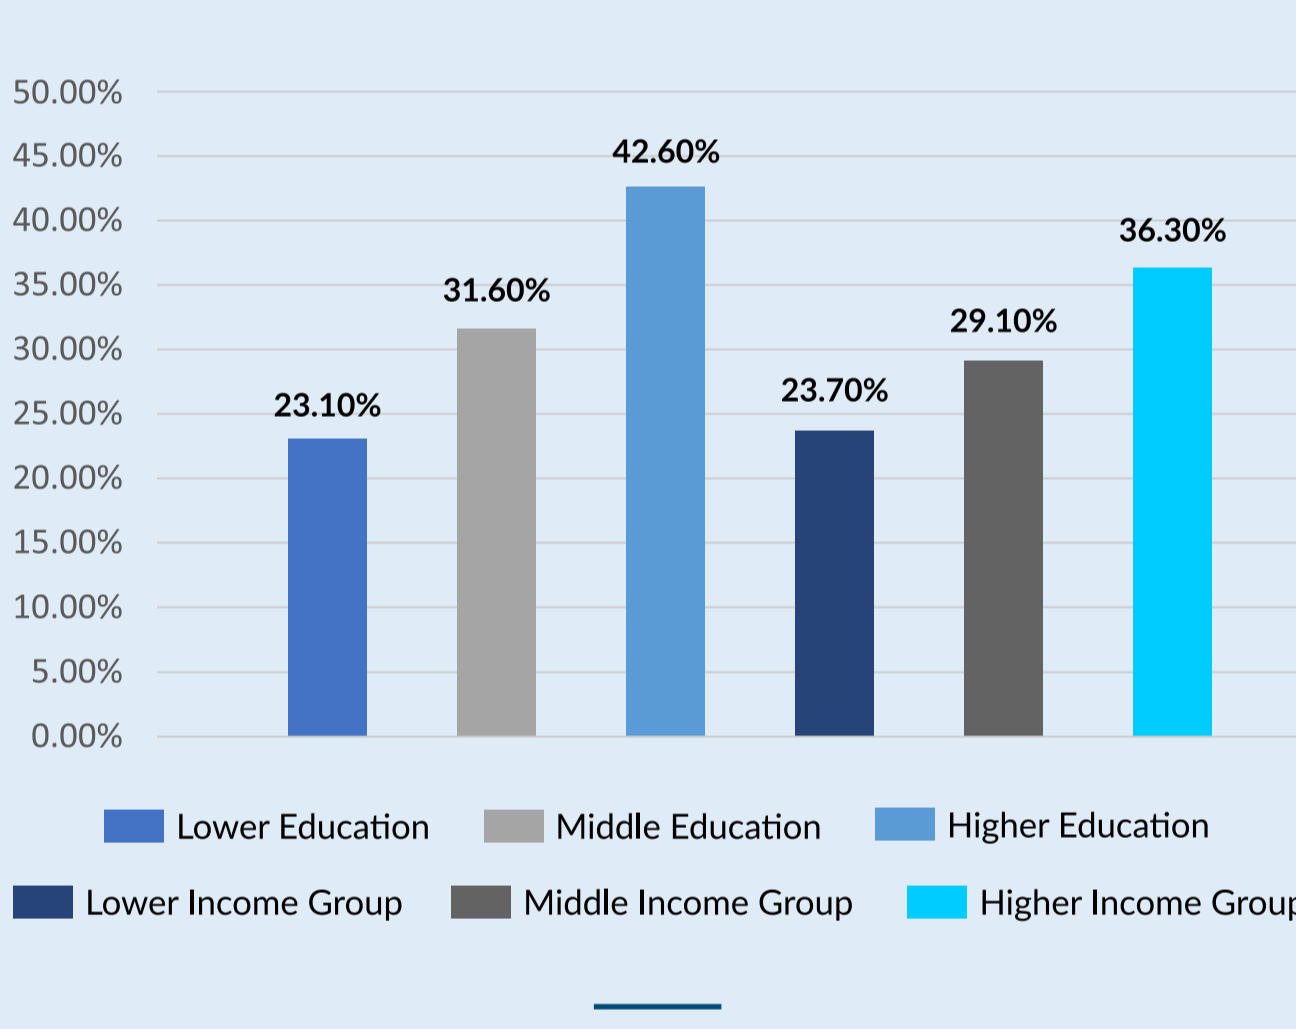

Majority of respondents have been taking better care of their health (65.4%), doing more household work (55.7%) and spending more time with elders in the family (58.5%) amidst the Coronavirus crisis.

Only 27.5% of respondents said that they were able to work from home during the lockdown, while 6.3% of respondents said they were already doing this before the Coronavirus lockdown. This means roughly only 34% of respondents were working from home during the lockdown.

Who was working from home during the lockdown?

As expected, respondents in higher education and higher income groups reported much likely to be able to work from home as compared to those with middle and lower education.

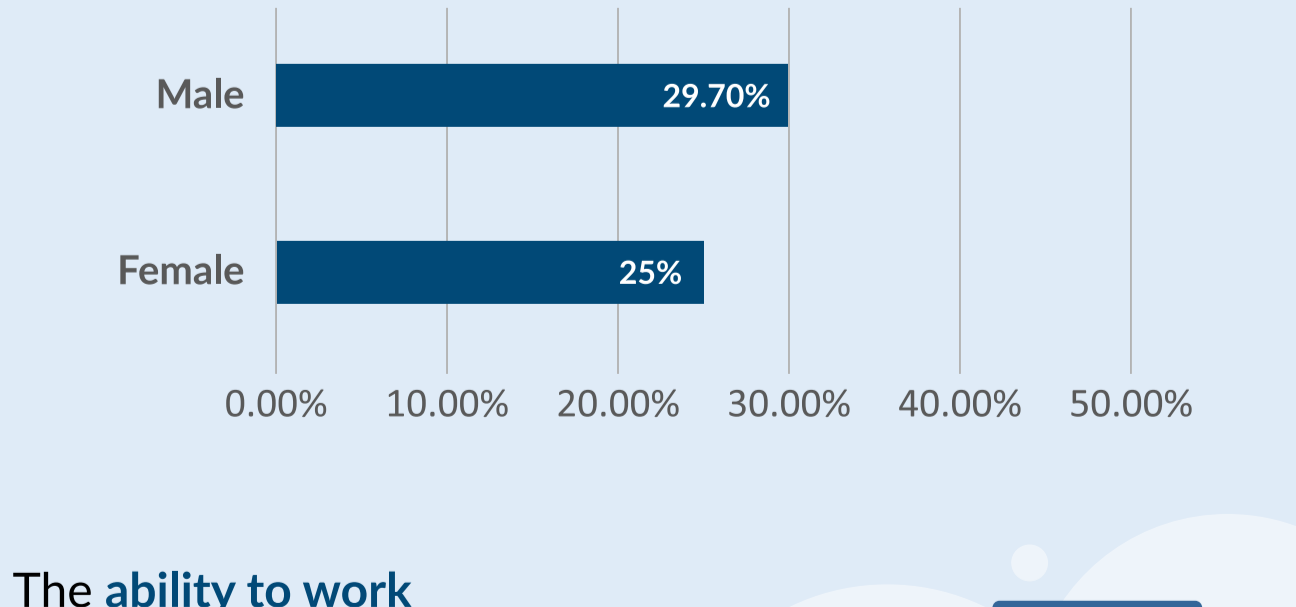

42.6% of those with higher education said they were able to work from home during/because of the Coronavirus lockdown, while 36.3% of those in the higher income groups said the same. This figure was substantially lower for those in the lower education (23.1%) and income groups (23.7%).

Usually, those with higher education and income tend to have more job security, luxury and resources to work from home as compared to those with lower education and job security.

Interestingly out of all age groups, of those in the middle age group, only 19.4% said they were able to work from home during/because of the Coronavirus crisis. While 35.4% (Below 25) of freshers said they were able to work from home and 24.7% of youngsters (25-45) said the same.

The ability to work from home also varied slightly by gender, with roughly 30% of males stating they were able to work from home, while only 25% of women said the same.

All survey findings and projections are based on the Team CVoter COVID 19 survey carried out in May 2020 among 18+ adults statewide, including every major demographic.

The data is weighted to the known demographic profile of every state, including age group, social group, income, region, gender and education levels. (Sample Size: 1423)
