01st
June
2020

Unlock Phase 1 (With Lockdown 5.0 in containment zones only)

Has the fear of Coronavirus risen as lockdown relaxations are being introduced?

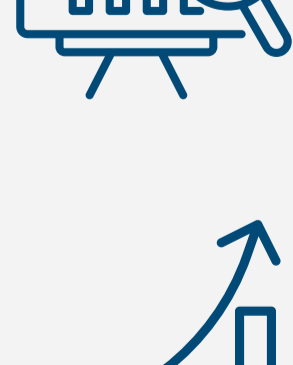

Since the announcement of Lockdown 4.0 on 18th May with relaxations and the subsequent unlock phase 1 announced from June 1st, we observe the percentage of respondents who think they or someone in their family could catch the Coronavirus has been increasing.

Throughout the lockdown period in April and May (till May 18th), the percentage of respondents who thought they or someone in their family could catch the Coronavirus remained steady at around 40-45%. However, after the announcement of relaxations and the unlock phase, the percentage has been increasing from 44% to around 52% as of June 5th.

More Indians think the threat from Coronavirus is being exaggerated as lockdown relaxations are being introduced

Until the announcement of the first lockdown, more than half Indians believed that the threat from the virus was being exaggerated

Throughout the month of May (till before Lockdown 4.0) the percentage of Indians who thought the threat of the Coronavirus was being exaggerated was stable at around 30%.

However, since the lockdown relaxations have been introduced and the subsequent unlock phase, the percentage of Indians who think the threat is being exaggerated has increased to 39% (June 5th).

Current survey findings and projections are based on the Team CVoter daily tracking poll conducted from March 22nd 2020 to June 5th 2020 among 18+ adults statewide, including every major demographic.

The data is weighted to the known demographic profile of every state, including age group, social group, income, region, gender and education levels.
